

ABSTRACT OF THE DISCLOSURE

There are provided a first imaging lens and a second imaging lens whose image picking-up directions are different, a reflecting member for changing an optical path of an image picked up via one imaging lens such that image forming direction of the first imaging lens and the second imaging lens are set in the same direction, an imaging device having imaging surfaces on which images picked up via the first imaging lens and the second imaging lens are formed, a signal processing member for signal-processing an image signal that is converted into an electric signal by the imaging device, a display portion for displaying the image signal which is subjected to the signal processing by the signal processing member, and a selecting member for selecting the image signal corresponding to any one of the first imaging lens and the second imaging lens to display it on the display portion.
